1. Administrative Overview

The BelayReports.com platform uses a **role-based access control (RBAC)** model to manage what each user can see and do. Administrative users have elevated privileges that allow them to manage other users, view all organizational data, and perform critical maintenance tasks such as data recovery.

This manual is intended exclusively for users with **Admin** or **Super Admin** roles. Standard users should refer to the General Onboarding Guide for their documentation needs.

Role	Scope	Key Capabilities
Standard User	Own reports only	Create, edit, and submit their own reports; view their own history.
Admin	Organization-wide	

Role	Scope	Key Capabilities
		All standard capabilities plus: manage users, view all org reports, access data recovery.
Super Admin	System-wide (all organizations)	All admin capabilities plus: manage multiple organizations, system configuration, billing.

2. Accessing Administrative Features

Administrative features in Rope Works are not located on a separate admin portal. Instead, they are integrated directly into the main application interface and become visible based on your assigned role. The primary entry point for all administrative functions is the **User Profile Menu**, accessed by clicking the **circular user avatar icon** in the top-right corner of every page. Note that the "Excellent" sync status button nearby is a separate connection quality indicator and does not open the profile menu.

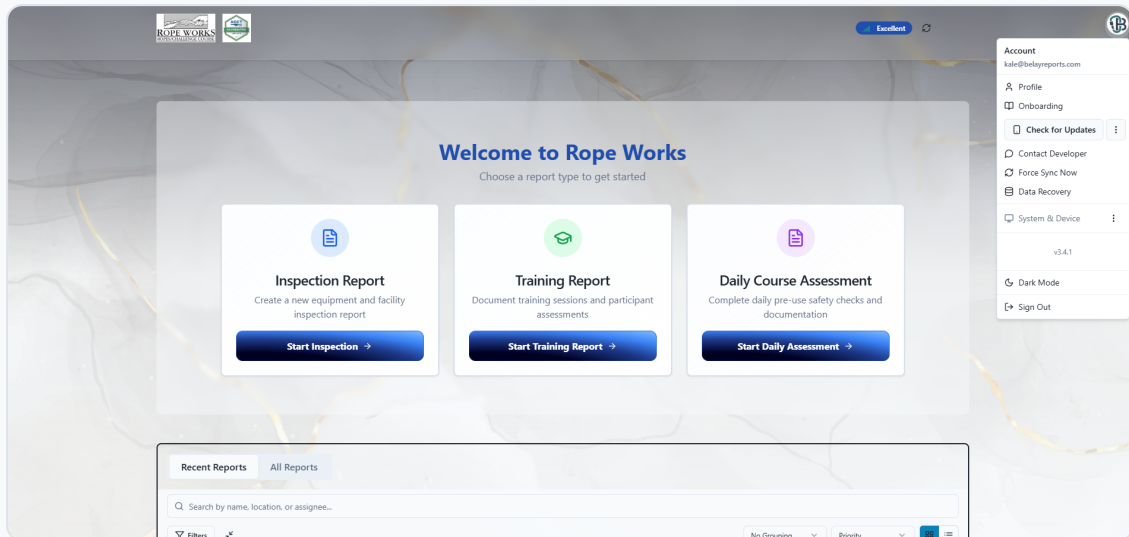

Figure 1: The User Profile Menu, opened by clicking the circular user avatar icon in the top-right corner.

For Admins and Super Admins, this menu contains additional links not visible to standard users, including links to User Management, Organization Settings, and the Data Recovery tool.

3. User Management

3.1. Creating New Users

Admins can create new user accounts within their organization. The platform does not send automated invitation emails. Instead, the admin creates the user's account and password, and must then manually communicate the login credentials (email and password) to the new user, either verbally or through their own separate email system.

- 1 From the User Profile Menu, select **User Management**.
- 2 Click the **Add User** button.
- 3 Fill in the user's first name, last name, and email address. Assign them a role (Standard User or Admin) and set a temporary password.
- 4 Click **Save / Create User**. The account is now active.
- 5 **Important:** You must now contact the new user and provide them with their login email and the temporary password you created.

3.2. Editing and Deactivating Users

From the User Management screen, you can edit a user's role or deactivate their account. Deactivating a user prevents them from logging in but preserves all their historical data. It is recommended to deactivate users rather than delete them to maintain a complete record.

4. Organization-Wide Report Management

4.1. Viewing All Reports

Admins and Super Admins can view all reports created by any user within their organization(s). This is done through the main dashboard by selecting the **All Reports** tab. The same search, filter, and grouping tools available to standard users can be used to navigate the complete set of organizational reports.

4.2. Advanced Filters for Admins

In addition to the standard filters, admins have access to an **"Assignee"** filter that allows them to view all reports assigned to a specific user. This is useful for auditing, performance reviews, or locating reports from a specific team member.

4.3. Report Ownership Tool

The **Report Ownership Tool** is an administrative feature designed to detect and fix ownership mismatches where the recorded trainer of record does not match the currently assigned owner of the report. This tool provides a centralized interface to identify these discrepancies and reassign ownership to the correct user, ensuring data integrity and accurate record-keeping.

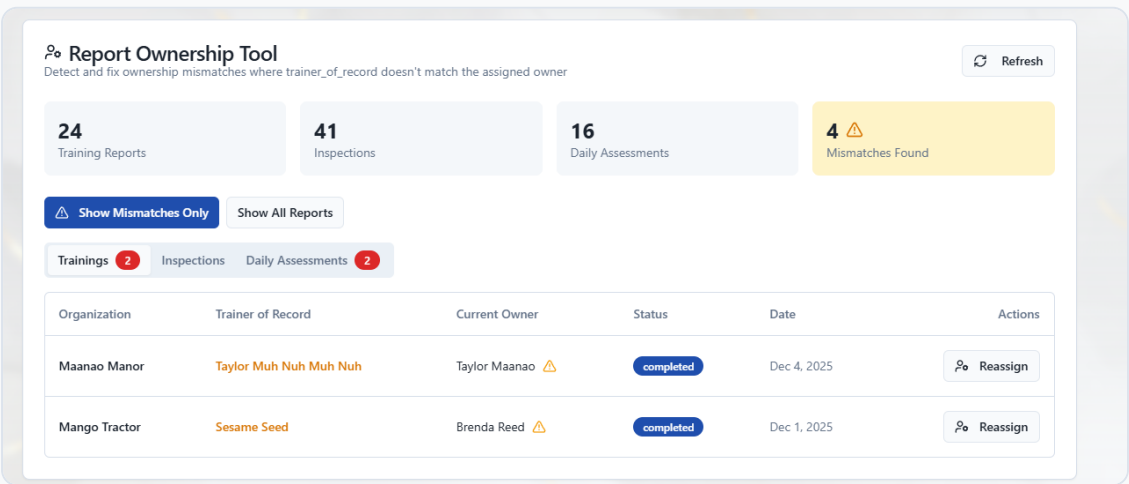

Figure 4: The Report Ownership Tool, showing a list of mismatched reports and the Reassign action.

The tool displays a summary of all reports by type (Training, Inspections, Daily Assessments) and highlights the number of mismatches found. Admins can toggle

between viewing only the mismatched reports or all reports. For each mismatch, the tool lists the organization, the current Trainer of Record, the current owner, the report status, and the date. The **Reassign** button allows the admin to correct the ownership directly from this interface.

5. Data Recovery

Data Recovery Access

This feature is visible to all users, but access levels differ by role. Standard users can only recover their own deleted data, while Admins and Super Admins can recover any report from any user in their organization.

5.1. Recovering Individual Reports

Any user can restore their own deleted reports, and Admins can restore any report in the organization. This is useful for recovering accidentally deleted reports without needing to contact support.

- 1 From the User Profile Menu, select **Data Recovery**.
- 2 Use the search and filter tools to locate the deleted report. The interface is similar to the main reports list but shows only deleted items.
- 3 Click the **Restore** button next to the report you wish to recover.
- 4 The report will be moved from the recovery archive back into the main reports list.

5.4. Restoring from a Full Backup

In the event of a larger data loss incident, such as a server-wide failure, it may be necessary to restore the entire system from a full backup. This is a more significant operation that can only be initiated by the **Belay Reports support team**. If you suspect a large-scale data loss, contact support immediately at support@belayreports.com with the approximate time the data was lost and the scope of the issue.

6. Super Admin Exclusive Features

The following features are available only to users with the **Super Admin** role.

6.1. Multi-Organization Management

Super Admins have a dropdown menu in the main header that allows them to switch between different client organizations. When an organization is selected, the entire platform context (reports, users, etc.) switches to that of the selected organization.

6.2. Super Admin Navigation Panel

Super Admins have access to a comprehensive navigation panel that provides centralized control over all aspects of the platform. This panel includes the following key sections:

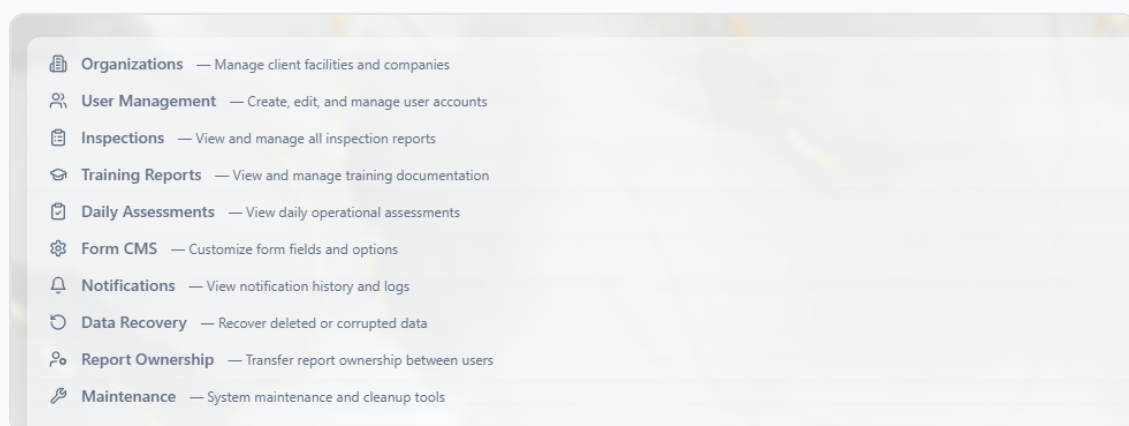

Figure 6: The Super Admin navigation panel.

- **Organizations:** Manage client facilities, companies, and their associated data.

- **User Management:** Create, edit, and manage all user accounts across all organizations.
- **Inspections:** View and manage all inspection reports from all users.
- **Training Reports:** View and manage all training documentation from all users.
- **Daily Assessments:** View all daily operational assessments from all users.
- **Notifications:** View a comprehensive history and logs of all system notifications.
- **Data Recovery:** Access the global Data Recovery tool to restore deleted or corrupted data for any user in any organization.
- **Report Ownership:** Use the Report Ownership tool to fix ownership mismatches across all reports.
- **Maintenance:** Access system maintenance and cleanup tools to ensure platform health and performance.

7. Administrative Best Practices

Regular Audits:

Periodically review user lists and report assignments to ensure accuracy.

Role Hygiene:

Assign roles based on the principle of least privilege. Only grant Admin or Super Admin roles to users who absolutely require them.

Backup Awareness:

Be aware of the data recovery options available and use them as the first line of defense against accidental data loss.
